

The factory roll-out of the first nacelle for the 309 MW Rentel Offshore Wind farm is a fact.

In this new facility, the different parts of the nacelle are assembled in separate production lines for the generator, hub and back end. They are then 'clicked' together at the end of the assembly lines, after which rotational and system tests are conducted, all indoor in this giant factory.

All offshore wind turbine components such as nacelles, blades, towers and electrical modules, will be shipped to the REBO Site in Ostend (Belgium) where additional assembly activities (tower assembly) and load-out on the installation vessel takes place.
